ADAM BIN ANWAR	243DC245L4	+60 13-665 7525	ADAM.ANWAR@student.mmu.edu.my

Objectives of the Project:

The objectives of this project are to enhance the secondhand marketplace by prioritizing fraud prevention. It will include user verification to build trust among users and a trust score mechanism to improve the overall user experience. Additionally, an item condition grading system will help address issues related to quality misrepresentation. The app's effectiveness in reducing perceived risks will be evaluated, ensuring that users can confidently engage in transactions.

Target User:

This project's primary target users are sellers and buyers who wish to declutter their homes, sell unused items, or generate side income and seeking affordable alternatives to retail purchases respectively. The secondary users will be the community groups organizing charity sales or neighborhood exchange events.

Scopes of the Project:

The project's goal is to develop an app that serves as a more reliable and trusted platform compared to existing options. To achieve this, we will implement an item condition grading system to prevent quality misrepresentation. Additionally, we plan to introduce a user verification and trust score mechanism to foster trust among users. Acceptance criteria is that every team member will conduct thorough testing of the app's functionality to ensure it operates as intended before seeking the supervisor's approval for the The project's exclusions will not include developing a native iOS version of the MyPreLove app. The app will only feature an English interface, and users will conduct transactions within private chats rather than through a payment processing system. Additionally, there will be no separate administrative web dashboard or content management system included in this scope. The constraint is that the development process must be completed within a six-week timeframe. Any changes requested after week six, especially after acquiring supervisor approval, will not be implemented.

Project Requirements:

Software: Android Studio, Visual Studio Code, Figma, GitHub, Canva

Hardware: Android mobile devices

Problem Statement:

This project's problem statement is that existing secondhand marketplace platforms in Malaysia, such as Carousell, Mudah.my, and Facebook Marketplace, are confronting three significant challenges that hinder their effectiveness. Firstly, there is a pervasive issue of trust and scams. Buyers and sellers often find themselves as strangers with no reliable verification processes in place, which frequently results in scams, the sale of counterfeit goods, and unsafe meet-ups. Secondly, the misrepresentation of item quality poses another challenge. Product conditions are often described using vague terms like "good condition" or "lightly used," any standardized criteria. This ambiguity can lead to buyer disappointment and disputes over the actual quality of items. Lastly, these platforms suffer from cluttered and irrelevant listings. General marketplaces are inundated with commercial sellers, dropshippers, and unrelated advertisements, making it increasingly difficult for genuine individual sellers to gain visibility and connect with potential buyers.

Type of Project:

[ ] Web based System / Stand alone System

[✓] Mobile Application

[ ] Multimedia Based System
